Executive Summary: NetAssure Labs (NetAssure Protocol Guardian)

Carrier-Grade Protocol Service Assurance (PSA) for the Agentic Onchain Economy
Founder: Samuel Apakuki Nayacakalou (17+ Years Telecommunications Service Assurance, Federal Government Cleared)

Target Round: $1.5M Seed Funding
Focus Ecosystem: Coinbase Base L2 & Coinbase Developer Platform (CDP)

Executive Overview

NetAssure Labs is pioneering the first **Protocol Service Assurance (PSA)** engine for the autonomous machine-to-machine economy. As artificial intelligence transitions from generating content to executing financial transactions, McKinsey projects that autonomous AI agents will mediate $3 to $5 trillion in global economic activity by 2030. Currently, **92.8% of all onchain AI agent payments occur on Coinbase's Base network**.
However, this $3T+ agentic commerce landscape is built on a highly volatile execution layer. Unlike human traders, autonomous agents suffer from "execution and safety lag". They lose millions silently to sequencer latency, frontrunning, transaction reorgs, and predatory Maximal Extractable Value (MEV) sandwich attacks.

NetAssure Labs solves this by introducing the **NetAssure Protocol Guardian (NAPG)**—an autonomous Network Operations Center (NOC) designed specifically for onchain agentic workloads. By porting carrier-grade telecommunications service assurance frameworks to smart contract telemetry, we ensure that enterprise AI agents can transact securely, efficiently, and with zero value leakage.

The Problem: The High-Frequency Agentic Execution "Minefield"

1. **Opaque and Volatile L2 Infrastructure:** Base operates with a centralized sequencer model. Without proactive monitoring, transactions read from "latest" states (200ms preconfirmations) can be rolled back during sequencer reorgs, leading to catastrophic financial errors for agents auto-crediting funds.
2. **Invisible Value Extraction:** L2 MEV (Latency and Whitelist MEV) operates as a "backdoor tax". Agents sending transactions to public RPC endpoints are routinely front-run or sandwiched by predatory searchers, executing swaps at highly disadvantageous prices.
3. **No Verifiable Trust:** Current Web3 agentic wallets offer static rule-setting (permissions and spend limits), but they have zero visibility into whether the matching engine executed the transaction fairly. For institutional capital to enter agentic DeFi, the execution layer must be cryptographically verified.

The Solution: NetAssure Protocol Guardian (NAPG)

NAPG is a Python-based autonomous agent, powered by CDP AgentKit and AgentiPy, that acts as an active safety shield for high-volume transacting agents.

- **Real-Time Telemetry Heartbeating:** Active monitoring of Base RPC node latency, sequencer health, and pool-depth volatility, translating carrier-grade network assurance (e.g., Moogsoft, Cisco routing logic) into onchain transaction pathing.

- **AgentShield Security Pipeline:** A mandatory 4-stage validation layer that runs transaction simulations (Tenderly), checks for honeypot contracts, and dynamically routes transactions through private RPC channels to completely eliminate MEV frontrunning.
- **Self-Correction Loops:** If an L2 transaction fails or experiences congestion, the NAPG parses the failure logs, dynamically adjusts gas parameters or swap routes, and self-corrects without requiring human developer intervention.

Market Opportunity & Timing: "Why Now?"

In mid-2026, the convergence of AI and Web3 payments reached a tipping point.

- **The Launch of "Coinbase for Agents":** Coinbase recently launched native agent accounts utilizing the open **x402 stablecoin payment protocol** (backed by AWS, Anthropic, and Circle), allowing LLMs to execute transactions autonomously.
- **Explosion in Agentic Infra Funding:** Institutional venture capital is aggressively backing this sector. Pantera Capital recently led a $4.3M seed round for Orthogonal (agent orchestration and payments), while Sequoia and Kleiner Perkins co-led an $80M round for Sail Research (agent workload infrastructure).
- **Unprecedented Capital Alignment:** Base has established itself as the dominant settlement, distribution, and commerce layer for AI-native finance. By deploying NAPG on Base, we tap directly into Coinbase's 110 million verified users and $80 billion in ecosystem assets.

Business & Monetization Model

NAPG utilizes three distinct, highly scalable Web3 native revenue channels:

1. **ERC-8021 Builder Code Revenue:** By registering our custom builder code on Base.dev, the Base sequencer automatically routes a percentage of protocol and transaction fees back to NetAssure, monetizing every trade our guardian secures without charging the user a direct fee.

2. **Autonomous Machine Payments (x402 API):** Other trading and SaaS agents pay micro-amounts of USDC (routed via x402 and AWS AgentCore) to query the NAPG API for real-time protocol safety metrics before executing high-value transactions.

3. **B2B Assurance Subscriptions:** Charging a monthly subscription (SaaS) to DAOs and DeFi vaults for active monitoring and automated fund migration during liquidity crises.

The Unfair Advantage (Founder Team-Market Fit)

NetAssure Labs is founded by Samuel Apakuki Nayacakalou, uniquely positioning the company at the intersection of deep internetworking security and programmatic finance :

- **17+ Years of GTAC Experience:** Managing carrier-grade service assurance for Australia's Federal Government clients at Optus. Extensive background in Cisco routing, unified communications, and complex network fault diagnosis.

- **Proven Algorithmic Track Record:** Designed and launched a self-coded Python automated trading bot that executed **60,000 trades over a 6-month period, achieving a 1.4% daily compounded return**.

- **High-Security Pedigree:** Holds active Federal Government clearance, establishing the operational discipline required to protect high-value enterprise financial workflows.

Financial & Funding Snapshot

Metric	Target	Strategic Focus
Seed Round Ask	$1.5 Million	18-month engineering and security auditing runway
Core Allocations	65% Engineering, 20% Audits, 15% GTM	Building out the Python core SDK, smart contracts, and high-frequency monitoring nodes
Key Milestones (12 Mo)	Launch NAPG Mainnet Beta, Secure 50 B2B Integrations	Reaching $30k MRR and processing $50M in secured agent volume

With your partnership, NetAssure Labs will build the foundational trust and reliability layer for the multi-trillion dollar machine economy on Base. We invite you to join us in securing the onchain future.
